AMENDMENTS TO THE CLAIMS

 (Original) A pump controller for controlling a pump for a fluid medium such as water, said pump controller including:

a metal substrate adapted to have a first side thereof exposed to said fluid medium;

an insulating medium applied to a second side of said substrate;

pressure sensing means including at least one pressure responsive element implemented on said insulating medium closely adjacent said substrate such that said pressure element is responsive to pressure of said fluid medium when said first side is exposed to said fluid medium;

flow sensing means including at least one source of heat and at least one temperature responsive element implemented on said insulating medium closely adjacent said substrate, such that said temperature responsive element is responsive to flow of said fluid medium when said first side is exposed to said flow, said fluid medium providing a sink for said source of heat in a manner that is related to said flow;

switching means for switching said pump on or off; and

processing means for receiving data from said pressure sensing means and said flow sensing means, said data being communicated via conductive tracks implemented on said insulating medium, said processing means being adapted for processing said data and for producing an output for driving said switching means.

- (Original) A pump controller according to claim 1 wherein said metal substrate includes titanium.
- (Original) A pump controller according to claim 1 wherein said metal substrate includes low carbon stainless steel.
- (Previously Presented) A pump controller according to claim 1, wherein said insulating medium includes a ceramic.

Amendment dated March 31, 2008 Reply to Office Action of October 3, 2007

5. (Previously Presented) A pump controller according to claim 1 wherein said pressure responsive element includes a plurality of resistors formed by conductive tracks on said insulating medium, said resistors being arranged such that pressure on said substrate is measured by a change in value due to tension on said resistors.

- (Previously Presented) A pump controller according to claim 1 wherein said temperature responsive element includes an operational amplifier and a bridge circuit containing a plurality of thermisters.
- (Previously Presented) A pump controller according to claim 1 wherein said switching means includes a triac.
- (Original) A pump controller according to claim 7 wherein said triac is mounted on said substrate to provide said source of heat.
- (Previously Presented) A pump controller according claim 1 wherein said at least one temperature responsive element includes a temperature sensor on each side of said metal substrate for detecting a temperature difference between said first and second sides.
- (Original) A pump controller according to claim 9 wherein said processing means is adapted to compensate for anomalies caused by said temperature difference.
- (Previously Presented) A pump controller according to claim 1 wherein said processing means includes a microprocessor or microcontroller.
- 12. (Original) A housing for a sensor substrate having a wet side and a dry side and adapted to promote contact of said wet side with a fluid medium and to substantially prevent contact of said dry side with said fluid medium, said housing including:

Application No. 10/814,178 Amendment dated March 31, 2008 Reply to Office Action of October 3, 2007

a main body having an opening for said fluid medium and for receiving said sensor substrate with its wet side exposed to said opening:

a first chamber maintained substantially at atmospheric pressure;

first sealing means arranged between said opening and said sensor substrate such that a leak path is provided to said first chamber;

a closure for said housing including a second chamber exposed to said dry side of said sensor substrate; and

second sealing means arranged between said closure and said first chamber to substantially prevent ingress of said fluid medium to said second chamber.

- 13. (Original) A housing according to claim 12 wherein said first sealing means includes a peripheral bead interposed between said wet side of said sensor substrate and an inner edge of said opening.
- 14. (Previously Presented) A housing according to claim 12 wherein said second sealing means includes a peripheral bead interposed between an edge associated with said first chamber and said closure.
- 15. (Previously Presented) A housing according to claim 12 wherein said first and second sealing means are connected by a membrane, said membrane providing an additional barrier to moisture reaching said dry side of said sensor substrate.
- (Original) A housing according to claim 15 wherein said membrane includes a recess for receiving a peripheral edge of said sensor substrate.
- (Previously Presented) A housing according to claim 12 wherein said first and second sealing means are formed from an elastomeric material.

Application No. 10/814,178 Docket No.: 0641-0261PUS1

Amendment dated March 31, 2008 Reply to Office Action of October 3, 2007

18. (Previously Presented) A housing according to claim 12 wherein said membrane is formed from an elastomeric material.

 (Previously Presented) A housing according to claim 12 including a venturi device adapted to accelerate flow of pumped fluid in the vicinity of said opening.

20. - 21. (Cancelled)
